# Learning Goals

- LCD Display memory
- Nokia LCD Display
- Using the LCD on the remote board

???

# Nokia Displays

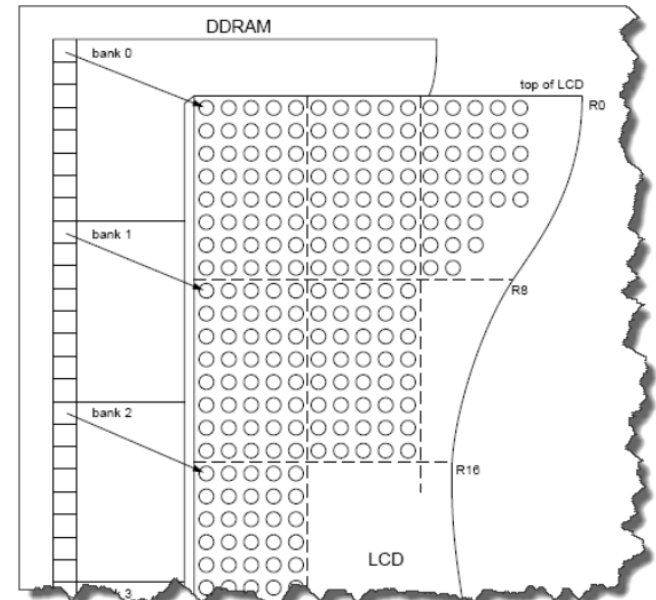

- Simple, large volume, low cost
- SPI interface (Philips PDC8544 display controller)
- 2nd Life Recycling
  - 'Zebra' connector
  - Mounted on PCB with backlight LEDs
- <https://mcuoneclipse.com/2012/12/16/zero-cost-84x48-graphical-lcd-for-the-freedom-board/>

# PDC8544

DISPLAY: 64 x 48 Pixel

- SPI interface (only MOSI)
- Cannot read display memory
- Draw operation in microcontroller RAM
- Write/Update display controller RAM
- Defined Sequence, Endianness, Orientation of bits in memory

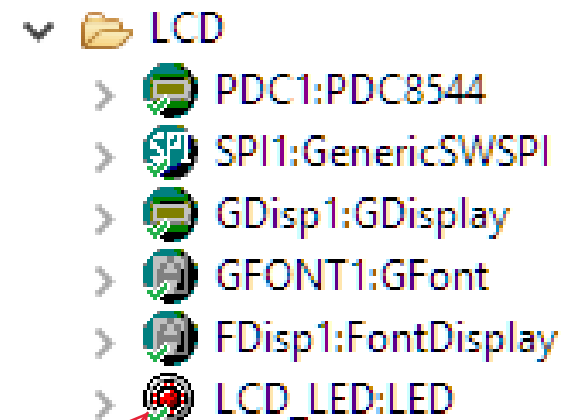

Source: Philips PDC8544

# LCD Components

- PDC8544
  - Philips PDC8544 display driver
- SPI
  - Display uses SPI
  - bit banging because of available pins
- GDisplay
  - graphical display routines (line, circle, ...)
- GFont
  - graphical fonts
- FontDisplay
  - Font writing routines
- LCD\_LED
  - Background illumination

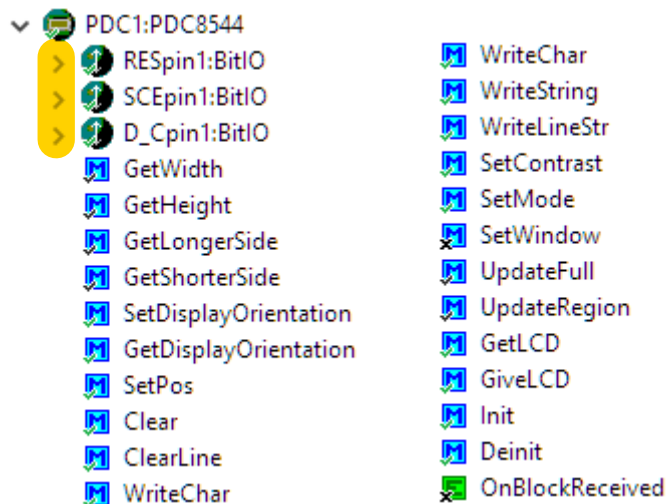

backlight functionality on the side

# PDC8544

- Low Level Display Driver
- Memory mapping (bit/byte order)
- Display properties (size) and critical section handling
- Includes basic character string writing (line based)
- `PDC1_WriteLineStr(1, "hello");`

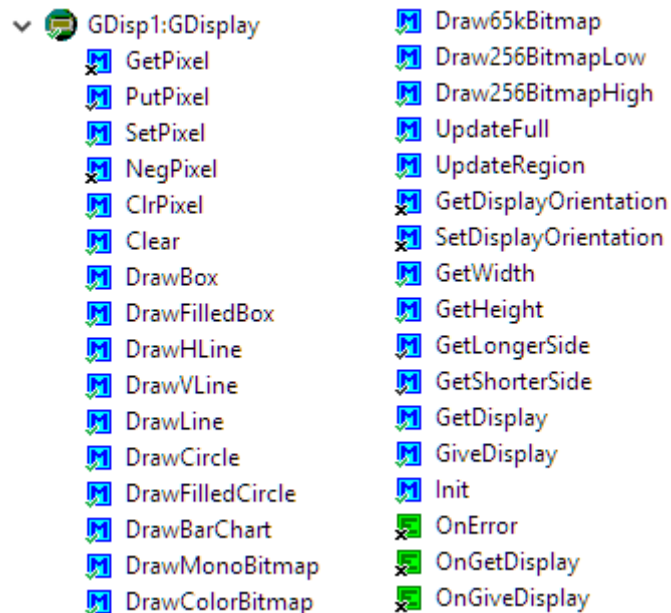

Don't change them!

Name	Value
Component name	PDC1
<b>▼ Properties</b>	
Width	84
Height	48
Bytes in rows	no
Bytes in x direction	yes
MSB first	no
Bits per pixel	1
Window capability	no
Display Memory Write	no
Type	LPH7366
Invert Display	no
<b>&gt; Initialize contrast</b>	Disabled
Mode	normal
Voltage	V3
<b>▼ HW non-LDD</b>	Enabled
RES	RES
SCE	SCE
D_C	D_C
<b>▼ SPI</b>	Enabled
SPI	SPI1
<b>&gt; HW LDD</b>	Disabled
<b>▼ System</b>	
Wait	WAIT1
Initialize on Init	yes

# GDisplay

no reading from display!

- Display drawing routines
- Set/Clear/Put/Get Pixel
- Display orientation
- Implements memory buffer

Name	Value
Component name	GDisp1
Inverted Pixels	no
▼ Memory Buffer	Enabled
Orientation	Landscape
Clear screen on Init	no
▼ Hardware	
Display	PDC1
> Watchdog	Disabled
> RTOS	Disabled

possible to change at runtime

# GDisplay Example

- Drawing into microcontroller memory
- UpdateFull(): write memory to display

it's also possible to update just one region (UpdateRegion) -> it's a bit faster!!

```
GDispl_Clear();      clear the display buffer
GDispl_UpdateFull(); write the display-buffer

GDispl_DrawLine(0, 0,
  GDispl_GetWidth(), GDispl_GetHeight(),
  GDispl_COLOR_BLACK);

GDispl_DrawCircle(
  GDispl_GetWidth()/2,
  GDispl_GetHeight()/2,
  10, GDispl_COLOR_BLACK);

GDispl_UpdateFull();
```

# FontDisplay & GFont

- Driver to write with fonts
  - WriteChar()
  - WriteString()
- Uses 'font handle': Pointer to font descriptor
  - GetFont()
- One component instance for font/size
- Variable character size

Name	Value
Component name	GFont1
> <b>Overwrite Bounding Box Height</b>	Disabled
Name	Helv
Size	8
Style	normal

Name	Value
Component name	FDisp1
> <b>System</b>	
Display	GDisp1
Font	GFont1
> <b>Watchdog</b>	Disabled

# Font & GFont Example

- x and y position passed by reference
- Incremented/changed for successive writing

```
FDISPL_PixelDim x, y;  
  
x = 0;  
y = 10;  
FDISPL_WriteString(  
    "Press a key!",  
    GDISPL_COLOR_BLACK,  
    &x, &y, pointer to where starting. why a reference?  
    GFONT1_GetFont() );  
GDISPL_UpdateFull();
```

# Summary

- LCD Memory map
- Low Level Display Driver
- Graphic Drawing Primitives
- Text and Fonts

# Lab: Nokia Display

- Use the Display
  - Draw Text
  - Draw Graphics
  - Write with Fonts
  - Display Button Status
